Mr. Eugene F. Adiutori
619 Waycross Road
Cincinnati 40, Ohio

Dear Mr. Adiutori:

Thank you for your letter of August 28 proposing a series of articles describing the stability of two-phase systems.

Since a major part of our coverage is on the subject of reactor engineering, such work is indeed of interest to us; however, our page budget would not allow us to consider devoting as much space as you propose (three or four articles at three to six pages each). Before we could give you a more definite answer as to the space that we could make available we would, of course, have to have more information about your work. If you could send us some background notes discussing the concept of "thermal stability" and its relation to flow and power oscillations (the first four points listed in your letter) then we could advise you more precisely concerning the extent of our interest shortly thereafter.

Sincerely,

Harold L. Davis
Associate Editor
